DIGITAL FORENSIC EXAMINATION REPORT

SIMULATED TRAINING REPORT — NOT AN OFFICIAL FORENSIC FINDING

Case CASE-2026-0045 | Alleged theft of two-wheeler motorcycle | Report date: 22 October 2026. All persons, vehicle details, investigative events, and findings are fictional. The attached image was AI-generated and is not CCTV evidence.

1. Case Identification

Case docket	CASE-2026-0045
Incident	Alleged motorcycle theft from a public parking area
Jurisdiction	Central Jurisdiction Local Police Station (fictional)
Crime reference	Motor vehicle theft; BNS Section 303(2) subject to verification
Sample complainant	Arun Kumar (fictional)
Illustrative vehicle	Black Honda Activa 6G, sample registration TN 00 AB 1234
Examiner	Demo Digital Forensics Analyst (fictional role)
Document classification	Educational application-testing specimen; not a certified report

2. Scope and Material Examined

This exercise examines only the previously generated CCTV-style illustration as a digital file. No original camera recording, DVR/NVR device, witness material, vehicle, or scene evidence was received. No physical forensic examination, image authentication, biometric identification, or video continuity analysis was performed.

Mock exhibit ID	CCTV-02
Source	AI-generated image created for application testing
File type	PNG image
File size	2,274,192 bytes
Image dimensions	1672 x 941 pixels
SHA-256 of this PNG	818c804806b457231339c4d553a1196f 7939ad192ffd11dcfb7838655b01626f
Hash interpretation	Computed for this illustrative file only; not proof of CCTV provenance

3. Methodology

The demonstration workflow consisted of (a) recording the file identity, format, dimensions, and byte length; (b) calculating a SHA-256 digest of the supplied PNG; (c) visually inspecting the illustration; and (d) documenting limitations and preservation recommendations. The digest identifies these exact file bytes; it does not verify the depicted events or the claimed capture time.

4. Observations and Interpretation

Visible scene: The illustrative frame depicts a public parking area, motorcycles, and a highlighted person near a motorcycle.

Overlay information: Camera and timestamp overlays are part of the generated illustration, not verified camera metadata.

Authenticity: The image is known to be AI-generated. It is unsuitable for establishing that a real theft took place.

Suspect identification: No real suspect identification can be made from this illustration.

Vehicle identification: No real vehicle ownership, registration, or chassis details were authenticated.

Time reconstruction: The illustrated timestamp is not evidence of when any real-world event occurred.

5. Chain of Custody and Evidentiary Status

CCTV-02 is a mock exhibit. Its origin in the application demonstration is known, but it has no genuine surveillance-device acquisition record, source-system log, or lawful seizure documentation. A real chain-of-custody record would require the collector, acquisition time and time zone, device/source, export method, storage location, integrity hash, and every handover. No such real evidentiary chain is asserted here.

6. Findings

F-01: The supplied PNG is an AI-generated illustration, not a verified CCTV export.

F-02: The SHA-256 digest above can be used to check whether this specific sample file changes.

F-03: The illustration cannot support a forensic conclusion concerning an actual offence, suspect, vehicle, or timeline.

F-04: No genuine CCTV footage or physical exhibits were available for examination.

7. Recommendations for an Actual Examination

• Obtain the original recording from the relevant DVR/NVR or camera system through authorized procedures.

• Record camera location, system clock accuracy, export process, and collection timestamps.

• Retain the original media read-only and compute cryptographic hashes on acquisition and transfer.

• Review relevant footage in temporal context and separately document any enhancements or annotations.

• Correlate video observations with verified registration records, scene observations, and witness statements.

• Have a qualified examiner document methods, tools, limitations, and independently reviewable results.

8. Conclusion

No forensic determination about the alleged theft can be reached from the available material. The only demonstrable technical result is the computed SHA-256 digest of the mock image file. The fictional investigation remains unverified, with no authenticated CCTV evidence, suspect identification, or vehicle recovery established.

9. Report Authentication

Prepared by	Demo Digital Forensics Analyst — fictional
Review status	Not reviewed by an accredited forensic laboratory
Official signature/seal	None — training specimen only
Report status	Final fictional sample for application demonstration

Appendix A — Mock CCTV Exhibit CCTV-02

AI-GENERATED IMAGE — NOT AUTHENTIC SURVEILLANCE EVIDENCE

Illustrative image included solely to demonstrate a forensic-report attachment. The content, overlays, and timestamp are fictional.
